

May 2, 2012

We have water features in two lobbies of our research facility. The features required weekly chemical treatment to minimize the growth of bacteria and algae. And even with the chemicals, algae still grew in the pool collection area of the features. Limescale was a long term problem accumulating on the side of the features and around the pool collection area. There are copper ridges embedded on the step portion of the features that are always encrusted in limescale. In fact, you couldn't even tell what type of metal they were, they were mostly white.

At the recommendation of Jersey Water Solutions we installed a HydroFLOW J62 on one of the features as a test. We were advised that we would see noticeable results within four to six weeks after installing the unit.

To my surprise we noticed substantial cleansing after the first week. The algae began to diminish, the color of the water was no longer green and the limescale started to release from the sides of the water feature and the copper ridges. After three weeks we reduced the chemicals we were using by 75 percent. The copper ridges started to shine again and the water was sparkling and shiny. Even one of our outside suppliers commented that the water was the cleanest he had ever seen.

Needless to say, we installed a J62 on the second water feature and are experiencing the same positive results.
